Cyber Sentinel is an interesting twist on a Turing machine - instead of a tape that can be moved right or left, a matrix is used allowing for a 2-dimensional puzzle to be constructed and solved. This game is not for everyone. If you don't enjoy the kind of puzzle that makes you feel like an idiot until you reach the "Eureka!" moment that makes you feel smart again, you won't like this. Some of the puzzles border on the fiendish, and I haven't even completed the game yet. I'm having too much fun optimizing my solutions to use the fewest number of states I can manage. You don't need to be a programmer, or even understand what a Turing machine is, to have fun with this game. Having a logical mind and enjoying puzzle solving is all you

---

really need and something puzzle afficianaods typically have anyway. Having done some fiddling with Turing machines in the past certainly helped me understand things quicker, though! Pros Great concept for a game, with credit granted to Alan Turing. You don't have to be as smart as Turing was to play the game. Good puzzles that ramp up in difficulty at a reasonable pace. Can share your solutions, and load and rate other player's solutions. Level editor included, so the game isn't over when you're done with the included puzzles. Very powerful state machines can be created and shared with the level editor. Several have already been uploaded that are quite impressive. The price point seems about right at \$10. Deceptively educational :) Cons, Nitpicks really Debugging is limited to pause and single step. A back step would be helpful. Breakpoints would be super useful for large and complex state machines. Being able to save your state machine to a file in order to try something and later reload if that line of thought fails would be nice. It wouldn't really need more than just a checkpoint/restore. Seeing what cube is at which state can be difficult during debugging, particularly if multiple cubes are at the same state. All in all, this is a great game for those who enjoy logic puzzles! Kudos to both the author, and the genius of Alan Turing.. Rating: 4 out of 10 The game has an Interesting game mechanic that lacks the necessary polish, and is not good if compared to Zachtronics games. The game is not totally bad, and maybe more fun on mobile devices, but apart from the concept there is nothing i like about it. I would only recommend to try this on PC if it was a free game.. In this pixel art game you will have to solve some very special puzzles that will require you to think a lot. A very evolutive difficulty. For the price of 1.99 you will spend hours of games to overcome the 45 levels and unlock all achievements.. Great game about visual programming with correctly increasing complexity If you like games like this, you should definitely buy it.. Great indie game, very addictive, intuitive gui and very well polished. Nice features like sharing your solutions and checking out others approaches to problem solving.. Nice puzzle game about finite state maschines. If you like programming games like Human Resource Maschine or Space Chem you'll have fun with this one. Besides the campaign there's a level editor and community levels comfortably downloadable from within the game. So there's as much content as you like. The campaign story might as well not exist, although the presentation is quite nice. But stories are not why we play these games, right? The controls can be a little finicky at times and cause you to accidentally delete a state transition or drag the wrong component. A feature to save/restore multiple solutions for a level similar to how HRM does it would be useful to be able to try different attempts.. This is fun. I am not exactly certain about the hacker thing because this game has little to do with real hacking. I believe that was added perhaps for marketing purposes. That said, you solve puzzles/challenges using logic. The goal is to solve the challenges with the fewest number of steps. The tutorial is helpful to get you started but it's easy to catch on and away you go. Most interesting to me was when your solution "blows up" ,you have the opportunity to tweak and get it right. Game can be finished in 4-5 hours. Certainly worth at least the current discounted price.. Great little game.
